Bright Coffee Shop Sales Analysis

Project Description

1. Introduction

The Bright Coffee Shop Sales Analysis project focuses on analysing coffee shop sales data to understand sales performance, customer purchasing patterns, popular products, and peak sales periods. The project uses historical transaction data to identify useful business insights that can support better decision-making and improve the overall performance of the coffee shop.

2. Problem Statement

Coffee shops generate large amounts of sales data through daily transactions. However, without proper analysis, it can be difficult to identify the best-selling products, the most profitable product categories, and the busiest sales periods. This project addresses this challenge by processing and analysing the Bright Coffee Shop sales dataset to present meaningful information in an understandable format.

3. Project Objectives

The main objectives of this project are to:

* Analyse sales data to understand overall sales performance.
* Identify the best-selling products and product categories.
* Determine peak sales times and examine sales patterns.
* Compare sales performance across different store locations.
* Use pivot tables, charts, and dashboards to summarise and visualise the results.

* Apply data analysis tools to turn raw sales data into useful business insights.

4. Dataset Description

The project uses the Bright Coffee Shop Sales Dataset, which contains transaction-level records covering the period from 1 January 2023 to 30 June 2023. The dataset contains 149,116 transaction records and includes information such as transaction date, transaction time, quantity sold, store location, unit price, product category, product type, and product details.

These fields allow the analysis of sales quantities, calculated sales revenue, product performance, and sales trends over time.

5. Project Scope

The project covers data inspection, processing, analysis, and visualisation. The data is organised and analysed using spreadsheet tools, pivot-style summary tables, charts, and a dashboard. SQL is also included as part of the project workflow for querying and analysing the sales data.

The analysis focuses on identifying sales trends, understanding product demand, and comparing performance across categories, times, and locations.

6. Expected Outcomes

The expected outcome is a structured sales analysis that presents the key findings in a clear and accessible format. The project aims to identify popular products, high-performing categories, busy sales periods, and differences in store performance. The findings can help the coffee shop understand its sales patterns and make more informed operational and product-planning decisions.

7. Tools Used

The tools used or planned for this project include:

* Google Sheets / Microsoft Excel: Data processing, calculations, pivot tables, and charts.

* SQL: Querying and analysing structured sales data.

* Google Looker Studio or Lovable: Creating an interactive sales dashboard, depending on the final dashboard selected.

* PDF: Presenting the project description and other written documentation.

8. Conclusion

The Bright Coffee Shop Sales Analysis project demonstrates how sales data can be transformed into meaningful information through data processing, analysis, and visualisation. By using spreadsheet tools, SQL, and dashboards, the project provides a clear overview of coffee shop sales performance and supports data-driven business decisions.
