Karabo Hope Shai
Project Planning

Data is provided in an Excel spreadsheet containing Bright Coffee Shop transaction data, including products, prices, quantities, dates and times.

The Excel dataset is converted to CSV format before being uploaded to Databricks.

Data is processed and stored in Databricks using SQL.

- Clean and convert unit_price
- Create transaction_time_bucket
- Calculate total_amount
- Group data using SQL

Processed data is analysed in Google sheets and Data Studio using Pivot Tables and charts to identify revenue, product performance, sales quantities and peak time intervals.

Findings are presented to the CEO using Canva.

- Key sales insights
- Revenue performance
- Best- and low-performing products
- Peak sales periods
- Recommendations

KEY INSIGHTS:

. Sales by product category and time interval
.High performing and low performing products
.Total revenue
.Peak sales periods
.Total units sold

KEY CALCULATIONS:

.Total Amount = unit_price x transaction _ quantity
.Grouped transactions into 30 minutes time intervals
.Total units sold =SUM (transaction quantity)
.Total REVENUE = SUM (total _amount)
.Sales grouped by product type and time bucket
